Rev. 4/07

California State Assembly

Ed Hernandez, O.D.

Assemblymember, 57th District

Dear Friend,

Diabetes is a serious health problem facing Californians. More than 20 million Americans have diabetes, and an estimated 225,000 will die from it this year — including a disproportionate number of Latinos, African Americans, Asians and Native Americans. Diabetes is the fifth leading cause of death by disease in the United States today.

The total annual economic cost of diabetes is estimated to be \$132 billion — or one out of every 10 health-care dollars spent in the United States.

Researchers have demonstrated — in early trial tests — that the progression of Type 1 diabetes may be halted or even reversed through stem cell transplants.

For information on diabetes legislation or other measures related to health care, please contact my office.

Sincerely,

ED HERNANDEZ, O.D.
Assemblymember
57th Assembly District

Millions of Americans
don't know
they have
diabetes.

**Are YOU
one of them?**

What is diabetes?

Diabetes is a group of diseases characterized by high levels of blood glucose resulting from the body's inability to produce and/or properly use insulin. Diabetes can cause serious complications and premature death, but people with diabetes can take steps to control the disease and lower the risk of complications.

The cause of diabetes is a mystery, although both genetics and environmental factors, such as obesity and lack of exercise, appear to play roles.

What are the typical forms of diabetes?

Type 1

An auto-immune disease in which the body does not produce any insulin, most often occurring in children and young adults. People with Type 1 diabetes must take daily insulin injections to stay alive. Type 1 diabetes accounts for 5-10 percent of all diabetes cases.

Type 2

A metabolic disorder resulting from the body's inability to make enough, or properly use, insulin. It is the most common form of the disease. Type 2 diabetes accounts for 90-95 percent of diabetes cases. Type 2 diabetes is nearing epidemic proportions due to an increased number of older Americans and a greater prevalence of obesity and a sedentary lifestyle.

Gestational

Gestational diabetes develops in about four percent of all pregnant women but disappears when the pregnancy is over. Women who have had gestational diabetes are at increased risk for later developing Type 2 diabetes.

You have a higher risk of developing diabetes if you are overweight.

Don't wait for the signs.

While there are sometimes obvious signs of diabetes, most people do not pay attention to the symptoms. If you or a family member have any of these symptoms, you should contact your doctor immediately. The most basic signs include:

- Extreme thirst
- Blurry vision from time to time
- Frequent urination
- Unusual tiredness or drowsiness
- Unexplained weight loss

Pregnant women should be tested for diabetes between the fifth and sixth months of pregnancy.

Facts you should know.

- Diabetes is a serious disease that can lead to blindness, heart attack, stroke, kidney failure, amputation and death.
- Diabetes is the fifth leading cause of death by disease in the United States, killing an estimated 225,000 people each year.
- The direct cost of diabetes represents 11 percent of total personal health care expenditures in the U.S. However, diagnosed diabetes patients account for only 4.9 percent of the total U.S. population.
- Direct medical costs in the U.S. attributable to diabetes total \$92 billion a year. Indirect annual costs total \$40 billion.

Find out if you are at risk.

Take this test and find out if you are at risk for diabetes. Individuals in certain ethnic groups, including Latino, African American, Native American, Asian and Pacific Islander, are disproportionately affected by diabetes.

(circle answer and add up points)

	YES	NO
1. My weight is above that listed in the chart below	5 pts.	0 pts.
2. I am under 65 and get little/no exercise on a usual day	5 pts.	0 pts.
3. I am between 45 and 64 years of age	5 pts.	0 pts.
4. I am 65 years of age or older	9 pts.	0 pts.
5. I had a baby weighing more than nine pounds at birth	1 pts.	0 pts.
6. I have a sister or brother with diabetes	1 pts.	0 pts.
7. I have a parent with diabetes.....	1 pts.	0 pts.

If you scored 3-9 points:

You are probably at low risk for having diabetes — but you may be at higher risk in the future. New guidelines recommend everyone age 45 and over to consider being tested for the disease every three years. People at high risk should consider being tested at a younger age. Contact your doctor regarding the proper frequency of testing for your particular health needs.

If you scored 10 points or more:

You are at high risk for diabetes. See a doctor soon and find out for sure.
